Preface

This Urban Database Series is aimed at to bring out comparable time-series and cross-section data on various urban topics. It is hoped that this would eliminate in some fields the repetitive compilations of same data by individual researchers, and, thereby, facilitate and promote urban research.

This first issue of the series brings together data on the main functional status of the cities and town in India in three census years, namely, 1961, 1971 and 1991. The functional classification of urban areas of India has been done using the same methodology that had been used by Asoke Mitra to determine the functional classification of cities and towns in 1971 and 1961. The computerised data for TLPCA (town level primary census abstract) has been used for determining functional classification of urban areas in 1991, while for 1971 and 1961 we used the functional classification done by Asoke Mitra and others.

Functional Classification of Urban Areas in India, 1961-1991

- An Introductory Note

Mahalaya Chatterjee and Pabitra Giri

1. Introduction

Cities and towns are outcome of a development process associated with diversification of the economic activities from agriculture to non-agriculture and characterised by spatial concentration of non-agricultural activities resulting from economies of scale and agglomeration economies. There is a range of non-agricultural activities, manufacturing, construction, trade, transport and services and incidence of such activities varies from one city to another. For understanding the urban scenario it is important to know what is the most important non-agricultural activity in the city or town. And from this standpoint, the functional classification of towns is an important component of urban study.

There was a long tradition of identifying functional classification of cities and towns by Census of India. However, prior to 1961, such classification was based on informed judgement of Census authority in various states and it was not so objective. In 1961 census, town level data for workers disaggregated by several (nine) industrial categories was made available. Using the workers data at town level, and a statistical methodology, Mitra (1964) set, for the first time, functional classification of the cities and towns on an objective footing. The 1971 census also provided workers data at the town level classified by the nine industrial categories. The joint study by Mitra, Sherry, and Dutt (1981) analysed the shifts in the functions of cities and towns of India during the period 1961-71. Census of India 1981 did not give workers data in nine industrial categories at the town level and thereby precluded functional classification of cities and towns in 1981. However, in 1991 census, again town level workers data by nine broad industrial categories was made available (in floppy disks), and thus providing scope for functional classification of towns. In fact Census of India 1991 (1994) has prepared a functional classification of cities and towns, but the methodology is slightly different from the one used in the studies by Mitra (1964) and Mitra and others (1981). So, with the Census 1991 functional classification it is not possible to study shifts in the functional characteristics of cities and towns over the last thirty years period from 1961 to 1991. In this context this study prepares functional classification of cities and towns of India using the methodology followed by Mitra. Further for each 1991 census towns and cities, not only the functional classification in 1991 is shown but also that in 1961 and 1971 provided the city/town has been existing in 1961 census also.

Below in Section 2, we first outline the methodology of functional classification followed by Mitra and then the methodology used by Census of India 1991. Finally we discuss how data has been processed and presented in this study. In Section 3 we discuss the definitions and concepts of workers used across the various censuses in India since 1961 and also about the industrial classification used in presenting town level workers data. This has been followed by a critical appraisal of the comparability of functional classifications of cities and towns for 1961, 1971 and 1991. The concluding section (4) reports some broad findings on the basis of the distribution of towns by size class and functional categories over time. It also gives how the database on functional classification of towns is arranged and some of its limitations.

2. Methodologies: A Comparative Perspective

The methodology followed by Mitra et al.:

In the first step, based on pursuits for the economically active population, agricultural towns are segregated from non-agricultural towns. There are four major divisions of activities, (i) agriculture and allied pursuits, (ii) manufacturing, (iii) trade and transport, and (iv) services. A city/town is defined as 'agricultural' where the percentage of workers in cultivation and agricultural labour taken together to all workers in it, exceeds the sum of percentages of all workers in the other three categories. (Since in 1961 census data on workers in activities allied to agriculture, like forestry, fishing etc. were merged with the mining and quarrying group, for determining 'agricultural' town only cultivators and agricultural labourers have been considered.) Among the three broad group of non-agricultural activities are manufacturing, defined to include, apart from household industry, manufacturing other than household industry, and construction, mining, quarrying, livestock, forestry, fishing, hunting, plantation, orchards, trade and transport including also commerce, storage and communications, and services. If majority of working population remains devoted to non-agricultural economic pursuits the towns and cities are treated as 'non-agricultural'.

In the second step, the percentage distribution of non-agricultural working force of each town among the three main non-agricultural categories is considered to determine its predominant function or main function type. For both 'agricultural' and 'non-agricultural' towns and cities, three main function types have been distinguished: manufacturing (M), trade and transport (T), and services (S).

However the relative importance of these three activities would vary across the cities/towns. Depending on the intensity of functions, i.e., how many workers are engaged in each of the three non-agricultural activity groups, four divisions were made and functional sub-types are identified: (i) one function highly accentuated, (ii) one function moderately accentuated, (iii) functions moderately diversified, and (iv) functions highly diversified.

Methodology followed by Census of India 1991 Study

The methodology adopted for the functional classification of cities and towns in 1991 is somewhat different from that adopted by Mitra. The first stage classification of towns into 'agricultural' and 'non-agricultural' categories as done by Mitra has been omitted and the functional classification was done on the basis of distribution of all workers into five sectors, which the nine industrial categories of Primary Census Abstract of 1991 are grouped into.

These five sectors are:

1. *Primary activity* comprising cultivator (Census industrial category I), agricultural labourers (II), livestock, forestry, fishing, hunting plantations, orchards and allied activities (III), mining and quarrying (IV);
2. *Industry* comprising manufacturing, processing, servicing and repairs (V) divided into household industry (Va) and other than household industry (Vb) and construction (VI).
3. *Trade* consisting of trade and commerce (VII);
4. *Transport* consisting of transport, storage and communication (VIII), while
5. *Services* consisting other services (IX).

From the percentage of total main workers in each of the five sectors for an urban agglomeration or a town, its functional category is determined as follows:

(i) If workers in one sector constituted 40 percent or more, the UA or town was classified in the relevant mono-functional category;

(ii) if the percentage in one sector was less than 40 percent, two sectors having the largest percentages were combined to see if they together constituted 60 percent or more. If so, the UA/town was classified in the relevant bi-functional category;

(iii) If no two sectors added up to 60 percent or more, three sectors having the largest percentage were combined and the UA/town was classified in the relevant multi-functional category.

In addition to the determination of the functional category of each urban agglomeration/town, in some cases sub-functional categories are also identified. Thus (a) forestry/fishing (including livestock, plantation etc.) and (b) mining and quarrying, these two sub-functional categories are distinguished when primary activity is the first or second leading function and the sub-function activity accounts for at least one-fourth of the total workers. Similarly if industry is the first or second leading function in an urban agglomeration /town sub-function types (c) household manufacturing and (d) construction are identified when the required condition is satisfied.

In this study we have adopted the Mitra's method of functional classification: on the basis of the composition of non-agricultural workers, cities and towns are classified into three main functional categories, manufacturing (M), trade and transport (T) and services (S). There are two reasons for adopting Mitra's procedure for functional classification rather than 1991 census procedure. First one is conceptual - one would agree that the basis of urban is non-agricultural activities, thus even in agricultural town the core of urban consists of non-agricultural activities. Therefore, to determine the functional characteristic of an urban agglomeration or town, we should consider which of the non-agricultural activities is most important. The second reason is one of convenience. Since the functional classification of urban agglomeration and towns for 1961 and 1971 has already been done using this methodology, applying the method to 1991 census data provides an opportunity for comparing the shift in functional characteristics of towns and urban-agglomeration over the three decades period from 1961 to 1991.

3. **Changes in definitions and classification and issues of comparability**

One important question is whether classification of towns in 1961, 1971 and 1991 are comparable. Two points are relevant here: first is the change of definition of worker in various censuses, second to what extent the classification of workers into nine industrial categories has changed over the census. Appendix A gives a comparative picture of changes in the definition of workers over 1961 to 1991. There are two major point: first, over time the definition of worker has been more stringent and one may expect that over time, the change in the aggregate number of workforce is relatively small. Second, but more important, from our point of view, is the differential effect of the change in definition of workers on the number of workers across the sectors. It appears that the data on workers in sectors like agriculture, retail trade and miscellaneous service activities,

having a greater incidence of casual worker are likely to be affected most by the increased stringency of definition of worker. On the other hand, in industrial activities, where relatively larger proportion of workers is likely to have steady engagements, the change in definition would not have much effect on the number of workers. This means that other things remaining unchanged, the change in the definition of workers would raise the proportion of workers engaged in manufacturing.

Another possible source of comparability problem is the effect of change in industrial classification scheme on the composition of broad industrial categories of workers. In 1961 Census, sectoral classification of workers was based on the Indian Standard Industrial Classification 1961, while in 1971 Census it was on the basis of National Industrial Classification (NIC 1970). Census of India 1991 used NIC 1987 for industrial classification of workers. A comparative chart of the composition of broad nine industrial category used in census in terms of ISIC and NIC components is given in Appendix B. In 1961 activity groups 'livestock, fisheries and forestry etc.' and 'mining and quarrying' are merged together for reporting town level worker data, but both in 1971 and 1991 censuses worker data for 'mining and quarrying' and that for the 'livestock, fisheries and forestry etc.' are given separately. In Mitra (1981), broad function group 'manufacturing' included the above two activities, apart from manufacturing and construction. To keep comparability the same has been done our exercise for 1991 census data also. While interpreting the change in the functional status of town, this should be kept in mind.

Apart from the points mentioned above, there is no serious comparability problem when we use the three broad functional categories, namely, manufacturing, trade and transport, and services for classification of towns. Of course, there may be an apparent doubt about comparability in relation to the treatment of repair activities, which are mostly classified as repair services (Major Group 97 in NIC 1970 and Division 97 in NIC 1987) under services and only a small part is included under manufacturing (for example, repair of capital goods – division 39 in NIC 1987, and in NIC 1970 along with corresponding manufacturing activity). However in the classification of broad industrial activity groups, the three censuses, 1961, 1971, 1981, all repair activities are included under manufacturing and processing activity (divided into household industry and non-household industry). Therefore change in NIC classification scheme, followed by Census in reporting worker data for individual activities (at three digit level), has not affected the over time comparability of the main function categories considered in the study.

4. Distribution of cities and towns by the size-class and function categories

Table 1 gives the distribution of cities and towns by the size-class (in terms of population) and the three broad function categories in 1961, 1971 and 1991. While for 1961 and 1971 only those towns which are common in both the census years are reported as done in Mitra (1981), for 1991 data are for all the towns and cities that existed at the time of 1991 census. It can be seen from this table that between 1961 and 1971 in most of the states of India the number of towns and cities with main function trade and transport had increased between 1961 and 1971, while the number of service towns declined in most cases absolutely. In some states the gain in the number of trade and transport based towns is at the cost of manufacturing towns. The growth in the number of towns with trade and transport as main functions continued during 1971 and 1991, followed by increase in the number of manufacturing towns and cities, while increase in the number of towns with service as main function is smallest. Another important fact is that except a few industrially developed states, the towns and cities with trade and transport as main functions dominated the urban scenario.

Now we briefly introduce the database on functional characteristics of towns compiled in this volume. In each state all the urban units of 1991 are arranged district wise. For each urban unit the following variables are reported for 1991:

- (a) Percentage of agricultural workers (cultivator plus agricultural labourers) to total workers in the town
- (b) Percentage of manufacturing workers (including the workers in mining and quarrying, forestry, fishing etc., and construction) to total non-agricultural workers in the town.
- (c) Percentage of trade and transport workers to total non-agricultural workers in the town.
- (d) Percentage of workers in other services to total non-agricultural workers in the town.

On the basis of the distribution of non-agricultural workers among the three broad activity groups, the main functional characteristic of each urban unit in 1991 is identified. The main functional characteristics of a town or a city in 1971 and 1961 is also indicated, if the city/town is covered in the study of Mitra et al. (1981), that is the cities and towns which are common to both 1961 and 1971 census. One limitation of this database is that it does give functional characteristics of towns that are not common to both 1971 and 1961 census, though the data are available.

Appendix - A: Comparative statement of definitions and concepts of work and workers used in Census of India 1961 to 1991

Year	Type of work	Economic criteria	Time devoted	Reference period
1961	Seasonal	For adult women otherwise engaged in household work, production for sale or work for wages	Some regular work of more than one hour a day	throughout the greater part of the working season
	Regular	For adult women otherwise engaged in household work, production for sale or work for wages	Employed on any day of the reference period	any of the fifteen days preceding the day of enumeration
1971	Seasonal	Participation in any economically productive work by his/her physical or mental activity	(No time criterion)	the last one year
	Regular	Participation in any economically productive work by his/her physical or mental activity	(No time criterion)	one week prior to the date of enumeration
1981	Seasonal	Participation in any economically productive work by his/her physical or mental activity	For a period of six months (183 days) or more (for main worker), (those working for less days are marginal worker)	One year preceding the date of enumeration.
	Regular	Participation in any economically productive work by his/her physical or mental activity	For a period of six months (183 days) or more (those working for less days are marginal worker)	One year preceding the date of enumeration.
1991	Seasonal	Participation in any economically productive work by his/her physical or mental activity	For a period of six months (183 days) or more (for main worker), (those working for less days are marginal worker)	One year preceding the date of enumeration.
	Regular	Participation in any economically productive work by his/her physical or mental activity	For a period of six months (183 days) or more (for main worker), (those working for less days are marginal worker)	One year preceding the date of enumeration.

Legend and notes

- * New town in 1991
- ** New town in 1981
- # New town in 1971
- @ Town declassified in 1971
- @@ Town declassified in 1961

Agrpc: percentage of agricultural workers (cultivators plus agricultural labourers to total worker (in 1991)

Mfgpc: percentage of workers in manufacturing (including construction, mining and quarrying, and fishing, forestry, plantation etc.) to total non-agricultural workers (in 1991)

Ttpc: percentage of workers in trade and transport to total non-agricultural workers (in 1991)

Srpc: percentage of workers in other services to total non-agricultural workers (in 1991).

M : Town with manufacturing as main function.

T : Town with trade and transport as main function.

S : Town with services as main function

Notes: (1) Since urban areas are reported districts wise in this table, the data for the cities or towns which are spatially spread over two or more districts, are reported in parts. So the distribution of workers and functional characteristic for each part is given separately in the main table. There are only a few such city and towns. The data for whole town/city is given in the appendix to the main table.

(2) In 1991 Census, in Haryana, Faridabad and Faridabad Industrial Township are merged together and reported as FCA (Faridabad Complex Administration)
